About Brain Injury

Definition

[Source: Champlain ABI Coalition](#)

Damage to the brain, which occurs after birth, as a result of a traumatic or non-traumatic event and is not related to a congenital or degenerative disease, can result in temporary, prolonged or permanent impairments in cognitive, emotional, behavioral or physical functions is considered to be an ABI.

Trauma, such as from a fall or motor vehicle accident, stroke, aneurysm, tumor, exposure to toxins and infections of the brain, and strokes resulting in a brain injury are some common causes of acquired brain injury.

About Rehabilitation

Source: TBI Network

After a brain injury, people can go through a number of different stages of medical treatment and care. If the person requires hospitalization after a brain injury they will be admitted to an acute care or community hospital where the doctors take care of the urgent medical issues and the person begins the rehabilitation process. Some people will be discharged relatively quickly from hospital. Others will need to participate in a rehabilitation program before they are able to go home. Some will continue rehabilitation after they return home. It's important to remember that rehabilitation is a process and is not the same for everyone.

The most common places someone receives rehabilitation are:

In hospital – for people who are patients in a community, acute teaching or rehabilitation hospital.

Outpatient (also known as Day Hospital or Ambulatory Care) – for people who can travel to the hospital for each rehabilitation session.

Home/community – for people who can travel to a community-based clinic to receive their rehabilitation. Or, the rehabilitation professional comes to the person's home, usually because the person cannot travel.

As a person with ABI moves through the recovery process, their health care team will contact the Champlain CCAC ABI System Navigator who then coordinates referrals to the Champlain ABI Coalition. This specialized group is made up of publicly-funded and/or not for profit agencies or organizations providing ABI services and supports.

If you have any questions about services and resources available for those living with the effects of an acquired brain injury (ABI) across the Champlain Region, you can contact:

Concussion Safety

A Concussion is a Brain Injury. A concussion can change the way the brain normally functions. It can be caused by a bump, blow, or jolt to the head or the body that causes the brain to move within the skull, resulting in altered brain functioning.

You cannot see a concussion. Even what might seem to be a mild bump to head could be serious. If an individual experiences one or more of the signs and symptoms after incurring a bump, blow, or jolt to the head or body seek immediate medical attention informing them of the symptoms present and the injury sustained. Signs and symptoms of concussion can show up right after the injury or may not appear or be noticed until hours, day or weeks after the injury.

Take extra care and precaution with young children. If they're just not acting right, crying or all of a sudden having trouble in school, you should seek immediate medical attention.

Signs and Symptoms of a Concussion

- Temporary loss of consciousness or unresponsive
- Lack of awareness to their surroundings
- Impairment in memory and with concentration
- Dizziness and/or vomiting
- Nausea and/or vertigo
- Feeling stunned, dazed or confusion
- Difficulty with following conversation and/or directions
- Balance and/or orientation problems
- Fuzzy, double or blurred vision
- Sensitivity to light and/or noise
- Headache, pressure in head, neck pain
- Changes in emotions, personality
- Depresses mood, increased irritability or anxiety
- Changes in sleep patterns
- Trouble sleeping
- Drowsiness

Recovery periods can vary with each individual and range from a week, to months.
