## Post-Stroke Depression

Post-stroke depression may affect as least one in every four individuals who have had a significant stroke event. The stroke patient is at greatest risk in the first six months after a stroke. Depression may affect a patient's ability to participate in post-stroke therapy and is associated with slower progress in rehabilitation and increased length of stay. Clinicians need to be watchful and recognize depression before it interferes significantly with therapy and the patient's well being. Standardized screening assessments for depression can indicate that depression exists and also can be used to monitor progress. However, there is no single, universally accepted tool for the assessment of post-stroke depression. An alternative to verbal scales to assess mood should be sought when assessing someone who is aphasic.

Anxiety should be assessed and treated, especially when found in conjunction with depressive symptoms. Antidepressant medications and counseling appear to be helpful in treating this condition. Aphasic patients provide a unique challenge for assessment and treatment.

## Signs of Post-Stroke Depression

### Physical Signs

- Trouble sleeping
- Weight loss
- Decreased energy
- Easily fatigued

### Attitudes

- Not caring about anything
- Loss of interest in things that were previously enjoyed
- Negativity: everything is gloomy
- Self-focus: me, myself and I
- Difficulty connecting to others

### Emotions

- Feelings of hopelessness and worthlessness
- Sadness and anxiety or nervousness
- Thoughts of death and suicide
- Difficulty coping, easily overwhelmed

### Mental function

- Difficulty concentrating
- Problems making decisions
- Confused, feeling of living in a fog
- Short-term memory problems

## The Impact of Stroke on the Survivor's Family

*Stress* from:

- The disruption of household routines
- The need to cope with new issues or problems

*Worry* that:

- Their loved one will fall
- Their loved one will have another stroke or die

*Sadness*, anger, or frustration about:

- The loss of their social life or time at work
- The loss of time for themselves

*Guilt* about:

- Living in their own home while their loved one is in a hospital or long-term care home
- Taking time for themselves instead of spending all their time with their loved one

*Grief*:

- Intense sadness, just as if the survivor had died
- Feeling they have lost the person the stroke survivor used to be.
